

RINGS OF RISK

Nairobi's flood hotspots and the walking routes they sever

Contour rings show where flooding has been detected repeatedly over 10 years (2014–2024) using cloud-penetrating Sentinel-1 SAR satellite data.

Dashed lines are road segments falling inside high or chronic flood zones – routes on which pedestrians and cyclists depend daily, with no dedicated infrastructure to protect them.

Sources: AI for Good Lab / Microsoft Flood Dataset (Nature Communications, 2025) . OpenStreetMap . WorldPop Kenya 2020
Methodology: Flood detections filtered for false positives (slope, soil moisture, temperature, land cover). KDE weighted by recurrence months. All roads assumed to carry pedestrian & cyclist traffic.

— Road – no flood risk
- - - Road – inside flood zone
